Domain 4: Workflow integration and solution design (16%)

Claude Certified Associate Foundations course · cheat sheet

4.1 From a messy request to clear requirements

Turn messy requests into requirements, must-haves, nice-to-haves and questions. Weigh every idea on value, risk and how often it's used.
Avoid: 1. starting work from the raw email · 2. treating every wish as a must-have · 3. adopting an idea because it sounds modern

4.2 Research, planning and fixing a slow process

Research gives you a starting point with graded sources. For a slow process, map it, find the bottleneck, and fix that first.
Avoid: 1. treating a research report as the decision · 2. automating a broken process as it is · 3. guessing the time saved instead of measuring

4.3 Building through feedback, and knowing when to hand off

Build in rounds, one change at a time, and test with the people who'll use it. When it needs logins, live company data or security, write a brief and hand it off.
Avoid: 1. building past the edge and hoping · 2. collecting feedback but changing everything at once · 3. a hand-off with no brief

4.4 Reshaping a workflow: augment or redesign

Augment helps with a step. Redesign changes the steps. Either way, build the human review into the design.
Avoid: 1. redesigning with no review step · 2. automating the wrong step · 3. not telling the people whose work changes

4.5 Explaining value and limits to stakeholders

Show the value with honest numbers, measured kept apart from estimated. Name the limits and what still needs a person, and recommend a next step you can measure.
Avoid: 1. presenting estimates as measurements · 2. hiding the errors · 3. 'AI will do it all' instead of what still needs a person
