Domain 5: Configuration and knowledge management (12%)

Claude Certified Associate Foundations course · cheat sheet

5.1 Setting up a project from zero

A project is a welcome pack. Name it, keep account memory out if it's client work, write clear instructions, and upload only the files that matter.
Avoid: 1. no instructions, so every chat starts generic · 2. uploading everything 'just in case' · 3. two clients in one project

5.2 Uploaded files or connected apps

Upload what's stable, connect what's living, and keep personal data out until it's cleaned. Connectors see what their account sees, and ask before they act.

5.3 Instructions that work, and where Skills fit

Instructions are the house rules, knowledge is the filing cabinet, and a Skill is the recipe card. Write rules you can check, and say which one wins when two conflict.
Avoid: 1. vague rules nobody can check · 2. putting facts in instructions and rules in files · 3. pasting a long procedure into every project instead of making a Skill

5.4 Keeping it current

Knowledge goes stale like food in a fridge. Give every file an owner and a check date, remove what's replaced, and prove each fix with a question you know the answer to.
